

ABSTRACT

A method of providing a terminal connected to at least
5 two communication networks with information regarding
services provided in said networks comprises the
following steps: providing a database server with a
database; collecting information regarding services
provided in said at least two communication networks in
10 said database server; storing said collected
information in the database as service information in a
uniform format; and transferring said uniform service
information to the terminal. With the method, an
overview of services provided by different digital
15 networks is obtained. A system, a terminal and a
computer program product are also provided.
